MELIFER

WHITE CLOVER

**MELIFER IS A WHITE CLOVER THAT
AS A SPECIAL ABILITY TO GROW IN MIXTURES**

MELIFER

Features:

- White clover
- Intermediate type
- Medium leaf type

Profile:

- Persistent
- ## Persistency:
- 4 years and more

Soil types:

- All types

Sowing rate:

- 3 to 4 kg/ha (1.2 to 1.6 kg/ac) in combination with grasses or in multi-species mixtures.

BENEFITS

- **MELIFER has an excellent behaviour within mixtures:**
 - Its intermediate size provides him access to light even in the presence of grasses;
 - Its good winter hardiness and drought resistance support its persistency in the pasture for many years;
 - Its high yielding potential improves the feed quality of multi-species pastures.
- MELIFER is a white clover variety suitable for various situations:
 - As an intermediate type, MELIFER can be grazed or used for hay production.
 - MELIFER produces many stolons and vegetative points, supporting its good regrowth ability and persistence even under trampling.
 - MELIFER is particularly adapted for grazing: its tall growth habit compared to dwarf types makes it very persistent even by over grazing.

FOR WHAT USE ?

Grazing	Mowing
	

Sowing July-September or March-April:

- Prepare a thin seed bed in order to get a good soil-seed contact;
- Sow at a depth of 1 cm;
- Roll right after sowing.

Protection:

- Monitor slugs during the establishment and take action if needed;
- Remove the weeds as early as 3-4 trifoliate leaves stage if needed (seek advice from your technician).

Packaging:
2 kg bucket
