L'AGRONOME SEMENCIER

M-ROBUST

Fodder Mixture

**FOR THE PRODUCTION OF EARLY,
HIGH-QUALITY AND HEALTHY FODDER**

M-ROBUST

Profile:

Semi-persistent mixture

Persistency: 3 years

Soil types:

- All types

Sowing rate (kg/ha):

- 30 kg

Composition (by weight):

25% FOXY tall fescue

20% ENDURO tetraploid hybrid ryegrass

45% LESTRIS red clover

10% ARAN large leaves white

ITS ADVANTAGES

M-ROBUST produces early and well-balanced forage:

M-ROBUST is based on hybrid ryegrass and early tall fescue:

- FOXY is a very early variety of tall fescue that improves the performance of the mixture
- ENDURO, which is very persistent (rating: 6.8), also produces abundant and leafy regrowth

In addition, the clover varieties selected are among the best in their categories and ensure continuous production between them:

- LESTRIS, a very persistent red clover also in mixtures.
- ARAN: White clover with broad leaves and elongated petioles, highly resistant to competition, helps maintain clover presence in the third year.
- Our clover seeds benefit from S.A.S STIM seed technology: seed pelleting with a biostimulant that stimulates crop emergence and strengthens stress tolerance

Balanced production:

- M-ROBUST offers very high production from the first cut thanks to tall fescue.
- Regrowth is then enriched with hybrid ryegrass, red clover and white clover, allowing consistent forage production throughout the year.

High and balanced feeding value:

- M-ROBUST provides balanced fodder with very good protein value thanks to the constant presence of clover.
- This mixture can be used in many situation.

Because combining the best varieties does not necessarily produce the best mixtures, this composition includes varieties that have been selected and evaluated for their suitability for mixing through appropriate breeding programmes.

The aim of this forage mixture is to secure production by adapting to soil heterogeneity and climatic hazards.

Therefore it contains species and varieties, chosen to guarantee the best performance.

IN WHAT SITUATIONS?

Grazing	Mowing

Sowing (August to September):

- Prepare fine soil on the surface and compact it deeply;
- Sow at a depth of 1 to 2 cm;
- Roll after sowing.

Protection:

- Watch out for slugs during planting and take action if necessary.

Fertilisation:

- Before applying any fertiliser, take into account the elements available in the soil by referring to the soil analysis and the nutrients provided by animals.

S.A.S STIM: seeds with biostimulant to stimulate crop emergence and strengthen resistance to stress
OSYR - AMM No. 108002 - Non-classified product -
Property of FRAYSSINET La Mothe 81240 ROUAIROUX.
Our S.A.S STIM coated seeds contain 70% bare seeds and 30% coating.

Packing:
15 kg bag

Route de la Métré - Beaufort-en-Vallée -
